

New!

RODIN

DB2 Web Query Edition

The new **RODIN DB2 Web Query Edition** automatically integrates RODIN's extensive metadata into your DB2 Web Query environment.

Whenever you create a Data Set table in RODIN, the table is automatically available for reporting from within DB2 Web Query. More importantly, RODIN's descriptive metadata is made available too. While building your data warehouse in RODIN your developers can enter unlimited descriptive text at both the table and column level to describe the business usage – and this is automatically included in the DB2 Web Query metadata. Need to modify a table? No problems – the changes are also reflected immediately in the DB2 Web Query metadata.

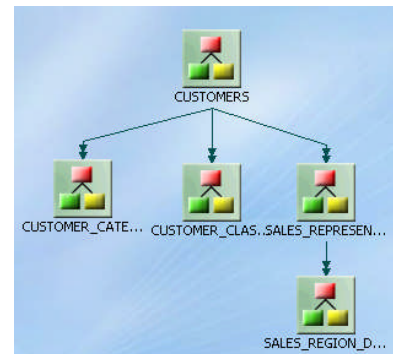

Your report authors won't have to guess at the meaning or usage of a table or column!

RODIN also allows you to define *Subject Area* models (e.g. star-schema data marts) including the logical join relationships between the tables. These models are also transferred to the DB2 Web Query Metadata, avoiding the need to define them a second time. Again, any descriptive text belonging to the model is included too.

Not only that, but RODIN automatically converts all of your date fields to true date format, making date arithmetic simple. Need a sales report by quarter? Easy!

Your report authors will be even more impressed!

Take a good look at the facts and decide if you should consider RODIN along with your DB2 Web Query plans! Ask for the new White Paper.
